Oral medicines that restore the gut barrier

Problem & Opportunity

- Inflammatory bowel disease (IBD) affects 6.8 million people worldwide.
- Up to 40% of patients lose response to biologic therapy within the first year.
- Annual direct costs of IBD care exceed $25 billion in the US.
- No approved therapy directly repairs the damaged intestinal barrier.

Science & Platform

- HT-101 is an oral, gut-restricted small molecule that restores tight-junction integrity.
- Minimal systemic exposure observed in preclinical models.
- Platform targets the epithelial barrier rather than suppressing the immune system.
- Designed as a once-daily oral tablet for use alone or alongside existing biologics.

Pipeline

- HT-101 Ulcerative colitis IND-enabling
- HT-102 Crohn's disease Lead optimization
- HT-201 Celiac disease Discovery
- IND submission for HT-101 planned for Q3 2026.

Market Size

- **TAM** $22.4B global IBD therapeutics market (2025).
- **SAM** $6.1B moderate-to-severe ulcerative colitis, US and EU5.
- **SOM** $610M projected peak annual sales at 10% share of SAM.

Key Milestones

- Completed GLP toxicology studies in two species.
- 62% reduction in intestinal permeability in a DSS mouse model (n=24).
- $3.2M NIH SBIR Phase II grant awarded in 2024.
- GMP drug substance manufacturing partner selected.

Leadership Team

- **Dr. Maya Okafor**, CEO - former VP Clinical Development at Arcadia Pharma; 15 years in GI drug development.
- **Dr. Daniel Reyes**, CSO - inventor of the barrier-restoration platform; PhD, Stanford
- **Priya Natarajan**, CFO - former biotech investment banker; led 2 IPOs.
- **Dr. Samuel Ortiz**, CMO - gastroenterologist; led 4 Phase 2 IBD trials.

Funding Ask & Use of Funds

- **Raising a $15M Series A.**
- Use of funds: 55% IND-enabling studies and Phase 1 trial; 25% CMC and manufacturing scale-up; 20% team and operations.
- Runway: 24 months, through Phase 1 data readout.
